DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/19/06 has been entered.

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-4, 10, 11, 14, 16-19, 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Suzuki et al. (US 5,600,462).

Referring to claim 1, Suzuki et al. disclose a device comprising a light incident surface for receiving the light; and a light emission surface for emitting the light incident on the light incident surface, wherein the light emission surface includes at least one light concentration unit which has at least two inclined surfaces on which the light is incident and refracted (Fig. 3, ref. 9), wherein a peak angle between the two inclined surfaces is in a range from about 90° to 120°

Application/Control Number: 10/679,771

Art Unit: 2871

(col. 5, lines 24-33). However, the reference does not disclose that the refractive index of the prism sheet is in a range from about 1.41 to about 1.49.

It would have been obvious to one having ordinary skill in the art at the time the invention was made for the refractive index of the prism sheet to be in a range from about 1.41 to about 1.49 since "...a prima facie case of obviousness exists where the claimed ranges and prior art ranges do not overlap but are close enough that one skilled in the art would have expected them to have the same properties" MPEP 2.44.05. Suzuki et al. disclose a refractive index of 1.50 (col. 4, line 24).

Referring to claims 2-4, Suzuki et al. discloses a device wherein the light emission surface includes a plurality of the light concentrate units each having at least two included surfaces and the peak angle; wherein the light concentrate units each have a shape of a prism column and are arranged parallel with each other in a longitudinal direction of the light concentrate units, wherein one of the two inclined surfaces forms a first angle with respect to the light incident surface and the other of the two inclined surfaces forms a second angle with respect to the light incident surface, the first and second angles are equal to each other (Fig. 3, ref. 9; Fig. 4, ref. 9).

Referring to claims 10 and 11, Suzuki et al. disclose the device previously recited, but fails to disclose that the light emission angle is in a arranged from about 5.86° to about 26.23°, and that the inclined surfaces are configured such that light incident on one of the inclined surfaces are travels in accordance with the claimed equations 1 to 3.

It would have been obvious to one having ordinary skill in the art at the time the invention was made for the light emission angle to be in a arranged from about 5.86° to about

Application/Control Number: 10/679,771

Art Unit: 2871

26.23°, and that the inclined surfaces are configured such that light incident on one of the inclined surfaces are travels in accordance with the claimed equations 1 to 3 since Suzuki et al. disclose the claimed structural limitations of the device. Having the light behave in accordance with the structural limitations of the device would naturally occur and is therefore obvious.

Referring to claim 14, Suzuki et al. disclose that the device further includes a body in which the light incident on the surface travels toward the light emission surface, wherein the body is integrally formed with the light incident surface and the light emission surface (Fig. 3, ref. 9).

Referring to claim 16, Suzuki et al. disclose that the prism sheet is made of polycarbonate (col. 4, lines 25-26).

Referring to claim 17, Suzuki et al. disclose the device previously recited, and further discloses that the peak angle is in a range from about 110° to 120° (col. 5, lines 33-35). As to the limitation that the refraction index varies in proportional to a value of the peak angle, it has been recognized that "[E[ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product by itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same or obvious from a product of the prior art, the claim in unpatentable even though the prior art product was made by a different process. MPEP 2113.

Referring to claim 18, Suzuki et al. disclose a device comprising a lamp assembly (7) for generating light, a diffusion plate for diffusing light (10); a prism sheet (9) for adjusting paths of the light, the prism sheet including: a light incident surface for receiving light; and a light emission surface for emitting light incident on the light incident surface, wherein the light

Art Unit: 2871

emission surface includes at least one light concentrate unit which has at least to inclined surfaces on which the light is incident and refracted, wherein a peak angle between the two inclined surfaces is in a range from about 90° to about 120° (col. 5, lines 33-35).

However, the reference does not disclose that the refractive index of the prism sheet is in a range from about 1.41 to about 1.49.

It would have been obvious to one having ordinary skill in the art at the time the invention was made for the refractive index of the prism sheet to be in a range from about 1.41 to about 1.49 since "...a prima facie case of obviousness exists where the claimed ranges and prior art ranges do not overlap but are close enough that one skilled in the art would have expected them to have the same properties" MPEP 2.44.05. Suzuki et al. disclose a refractive index of 1.50 (col. 4, line 24).

Referring to claim 19, Suzuki et al. disclose a device wherein the light emission surface includes a plurality of the light concentrate units each having at least two included surfaces and the peak angle; wherein the light concentrate units each have a shape of a prism column and are arranged parallel with each other in a longitudinal direction of the light concentrate units (Fig. 4).

Referring to claim 20, Suzuki et al. discloses a device wherein the lamp assembly has a plurality of lamps arranged parallel with each other in a selected direction, the lamps being disposed at a side of the diffusion plate opposite to a side at which the prism sheet is disposed (Fig. 1, ref. 7).

Art Unit: 2871

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Richard H. Kim whose telephone number is (571)272-2294. The examiner can normally be reached on 9:00-6:30 M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Nelms can be reached on (571)272-1787. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
